Building a 3D World "God's Eye" is a massive architectural undertaking. To make NotebookLM an effective "Command Center Brain," we need to feed it specialized knowledge in logical batches.

Below is the **Master Acquisition Plan** divided into **12 technical batches**. You can run these prompts through your Deep Search agent one by one, then upload the results into NotebookLM.

🛰️ Phase 1: The Foundations (Batches 1-3)

Batch 1: Geospatial Engines & 3D Rendering

Goal: Teach the brain how to visualize the planet in high fidelity.

Prompt: "Gather deep technical documentation on **Google Photorealistic 3D Tiles** and **CesiumJS**. Include: 1. API integration steps for streaming 3D mesh. 2. Performance optimization for **WebGPU** rendering. 3. Documentation on **CZML (Cesium Language)** for time-dynamic (4D) data visualization. 4. Comparative analysis of Cesium vs. Deck.gl for high-density point cloud rendering."

Batch 2: The Global Coordinate System (GIS)

Goal: Ensure the AI understands how to map data onto a sphere accurately.

Prompt: "Collect exhaustive guides on **Geospatial Coordinate Systems**. Focus on: 1. WGS84 vs. ECEF (Earth-Centered, Earth-Fixed) translations. 2. Converting RA/Dec (Astronomical) and TLE (Satellite) data into Cartesian coordinates (x, y, z). 3. Geospatial indexing methods like **H3 (Uber)** or **S2 Geometry (Google)** for efficient data querying."

Batch 3: Tactical UI/UX & Command Center Design

Goal: Create an interface that looks and feels like a professional defense tool.

Prompt: "Research **Military & Tactical HUD (Heads-Up Display) Design Principles**. Gather: 1. Best practices for dark-mode high-contrast geospatial interfaces. 2. Fitts's Law applications in rapid-click monitoring environments. 3. Iconography standards for MIL-STD-2525D (military symbols). 4. Case studies on successful Situational Awareness (SA) dashboards."

📡 Phase 2: Live Signal Ingestion (Batches 4-7)

Batch 4: Aviation Intelligence (ADS-B)

Goal: Monitor the skies with zero filtering.

Prompt: "Gather complete documentation for **ADS-B Exchange** and **OpenSky Network APIs**. Include: 1. Data schemas for transponder types (ICAO hex codes). 2. Methods for identifying

military/government aircraft versus commercial. 3. Python-based libraries for live flight tracking (e.g., pyModeS). 4. Historical flight path analysis techniques."

Batch 5: Maritime & Logistics Intelligence (AIS)

Goal: Monitor global trade and naval movements.

Prompt: "Extract technical manuals for **AIS (Automatic Identification System)** data structures. Focus on: 1. Message types (Type 1-27). 2. API schemas from AISHub and MarineTraffic. 3. Methods for detecting 'dark ships' (vessels that turn off transponders). 4. Port congestion and route-deviation analysis algorithms."

Batch 6: Orbital Mechanics & Satellite Surveillance

Goal: Track the watchers in space.

Prompt: "Collect data on **Satellite Tracking and TLE (Two-Line Elements)**. Include: 1. Documentation for the **SGP4 propagator** algorithm. 2. Orbital categories (LEO, MEO, GEO). 3. Identifying 'Spy' satellites (NROL, Persona, Cosmos). 4. Calculation methods for 'Sensor Cones' (visualizing exactly what a satellite can see on the ground)."

Batch 7: Electronic Warfare (Signal Noise)

Goal: Visualize invisible conflict.

Prompt: "Research methodologies for **GPS Jamming and Spoofing detection**. Gather: 1. How to analyze ADS-B 'Accuracy' fields to identify interference zones. 2. Crowdsourced jamming data structures from GPSJam.org. 3. Patterns of signal interference in conflict zones. 4. Visualizing RF (Radio Frequency) noise in a 3D environment."

🧠 **Phase 3: The Intelligence Layer (Batches 8-12)**

Batch 8: OSINT Scraper Swarm Logic

Goal: Automate the "reading" of news and social media.

Prompt: "Gather technical specs for building **OSINT AI Agent Swarms**. Include: 1. Integration of Gemini 3.1 Pro for **Multimodal scraping** (reading images/videos). 2. Monitoring Telegram/X/Discord via API or headless browsers. 3. **Geospatial Named Entity Recognition (G-NER)** to extract coordinates from text. 4. Real-time translation of foreign defense reports."

Batch 9: Infrastructure & Global Health Data

Goal: See the impact of events on society.

Prompt: "Research public datasets for **Global Infrastructure Monitoring**. Include: 1. Real-time internet traffic and blackout data (IODA/Cloudflare Radar). 2. Power grid health APIs. 3.

GDACS (Global Disaster Alert and Coordination System) data schemas. 4. NASA FIRMS (Fire Information for Resource Management System) for thermal tracking."

Batch 10: Historical Change Detection (4D Analysis)

Goal: Use the "Time Machine" feature effectively.

Prompt: "Gather documentation on **Satellite Imagery Change Detection**. Focus on: 1. **Google Earth Engine (GEE)** multi-temporal analysis scripts. 2. Pixel-based vs. Object-based change detection (OBIA). 3. Detecting new construction or military mobilization from low-resolution imagery. 4. Volumetric smoke/explosion analysis from visual data."

Batch 11: Predictive Modeling & World Models

Goal: Move from monitoring the present to predicting the future.

Prompt: "Research **Generative World Models** like **Genie 3** and **Sora**. Include: 1. Technical papers on 'Playable Realities.' 2. Using AI to simulate 'Course of Action' (COA) scenarios on a 3D globe. 3. Physics-informed neural networks for predicting movement (e.g., where a ship will be in 6 hours based on fuel/currents)."

Batch 12: Cybersecurity & Encryption of the Command Center

Goal: Protect your "God's Eye" from being hacked.

Prompt: "Identify **Security Protocols for Geospatial Data Platforms**. Include: 1. Encryption standards for real-time data streams. 2. Authenticating API sources to prevent 'Data Poisoning.' 3. Secure deployment of local-first LLMs for sensitive intelligence analysis. 4. Managing API rate limits and rotate proxies for OSINT scraping."
