To build your "God's Eye" command center, you can leverage two distinct but complementary Google technologies: **Google Deep Research** (the search agent) and **NotebookLM** (your knowledge brain).

The Technology Difference

Understanding the difference between these two "agents" is key to how you'll feed NotebookLM:

Feature	**Google Deep Research Agent (via Search/Gemini)**	**NotebookLM Research Agent**
Primary Goal	**Acquisition**: Browses the live web to find and synthesize new information into a report.	**Curation**: Analyzes and synthesizes the specific data you have *already* provided (docs, links, PDFs).
Data Scope	Entire public internet and live data streams.	Limited to your "Notebook" (up to 500 sources).
Output	A multi-page detailed briefing report with a research plan.	Q&A, Audio Overviews, and summaries grounded *only* in your sources.
Best For	Finding the latest documentation or current global events.	Building the internal logic and "brain" of your specific project.

Phase 1: Foundations & Visualization (Batches 1-4)

Use these prompts in your **Deep Search Agent** to gather the raw data files (PDFs/Markdown) to upload into NotebookLM.

Batch 1: The Rendering Engine (3D Foundation)

Prompt: "Generate a comprehensive technical briefing on **Google Photorealistic 3D Tiles** and **CesiumJS integration**. Include documentation on how to use **WebGPU** for real-time 3D rendering in 2026. Focus specifically on **CZML data schemas** for time-dynamic (4D) pathing of objects. Provide a step-by-step guide for linking Google Cloud Map Tiles API to a Cesium container."

Batch 2: Global Coordinate Intelligence (GIS Logic)

Prompt: "Perform deep research on **Geospatial Coordinate Conversions**. I need technical papers on converting **TLE (Two-Line Element)** satellite data and **ADS-B** flight coordinates into **ECEF (Earth-Centered, Earth-Fixed)** Cartesian points. Include documentation on **S2 Geometry** (Google's library) for spatial indexing of real-time movements."

Batch 3: Tactical UI & UX (The Control Room)

Prompt: "Identify the UI/UX standards for **Mission Control & Situational Awareness (SA) Dashboards**. Gather documentation on the **MIL-STD-2525D** symbology set for representing tactical assets on a map. Focus on high-contrast, low-latency interface designs suitable for monitoring 4D environments in a browser."

Batch 4: The Aviation Signal Layer (ADS-B)

Prompt: "Synthesize a deep-dive report on the **ADS-B Exchange API v3 (2026)**. Include data dictionaries for all fields (altitude, speed, squawk codes, military identifiers). Provide Python examples for streaming this data via WebSockets and methods for filtering 'non-commercial' aircraft in real-time."

Phase 2: Signal Intelligence & OSINT (Batches 5-8)

Batch 5: Maritime & Port Intelligence (AIS)

Prompt: "Gather the full documentation for **AIS (Automatic Identification System)** message types 1 through 27. Focus on identifying 'Dark Vessel' behaviors (AIS disabling detection). Include AISHub and MarineTraffic API schemas for tracking cargo and naval movements in conflict zones like the Strait of Hormuz."

Batch 6: Satellite Surveillance (Space-Track)

Prompt: "Research the **SGP4 Orbital Propagator** library for predicting satellite positions. I need a list of public TLE sources for **reconnaissance and imaging satellites** (NRO, Persona, Galfen). Include a technical explanation of how to calculate a 'Sensor Footprint' (ground-swath) based on a satellite's known camera specs."

Batch 7: Electronic Warfare & Jamming Detection

Prompt: "Conduct deep research into **GPS Jamming detection via OSINT**. Gather methodologies on how to use flight 'Navigation Integrity' data (from ADS-B) to map active jamming zones. Provide case studies or documentation on visualizing RF interference tiles in a 3D geospatial environment."

Batch 8: Infrastructure & Environmental Monitoring

Prompt: "Collect data schemas for **Global Infrastructure Monitoring APIs**. Focus on **Cloudflare Radar (Internet traffic/blackouts)**, **NASA FIRMS (Thermal/Fire tracking)**, and the **GDACS (Global Disaster Alert)** real-time feeds. I want to know how to ingest these as 'Events' in a 4D timeline."

Phase 3: The AI Brain & System Integrity (Batches 9-12)

Batch 9: AI Agent Swarm Orchestration

Prompt: "Develop a technical guide for building **Geospatial AI Scraper Agents**. Research the use of **Gemini 3.1 Pro's Multimodal capabilities** for extracting coordinates from images/videos on social media (X/Telegram). Include logic for a 'Reasoning Agent' that correlates flight diversions with satellite passes."

Batch 10: 4D Time-Travel & Change Detection

Prompt: "Perform a deep search on **Google Earth Engine (GEE)** multi-temporal analysis scripts. I need to know how to automate 'Change Detection' between historical and current satellite imagery to identify new construction or damage at specific coordinates. Provide the latest API functions for 2026."

Batch 11: World Models & Predictive Simulation

Prompt: "Research **Playable Realities** and the use of **Google Genie 3** for geospatial simulation. How can a real-time command center use generative world models to simulate 'what-if' scenarios (e.g., ship path prediction) based on live current data and fuel constraints?"

Batch 12: Security, Encryption & Data Poisoning

Prompt: "Summarize the best practices for **Securing Geospatial Intelligence Platforms**. Focus on protecting against 'Data Poisoning' of OSINT feeds and encrypting real-time ADS-B/AIS streams. Include documentation on local-first LLM deployment for sensitive 'God's Eye' analysis."
